Implantable cardioverter-defibrillators (ICDs) and cardiac resynchronization therapy (CRT) are commonly used in men and women in current practice. The smaller number of women in clinical trials and the lower risk of SCD in women have made it difficult to detect differences in outcomes with implantable device therapy.

### **Implantable Automatic Defibrillator - an overview**

Background: Implantable Cardioverter-Defibrillators (ICDs) are the standard therapy in patients with ventricular tachyarrhythmia (VTA) and provide a unique opportunity to analyze beat-to-beat (RR)-interval variability (HRV) before the onset of such life-threatening event.
